This comprehensive guide explores the fundamental sewing methods fashion designers need and teaches professional garment construction. Chapter One introduces sewing tools and machinery (including industrial machines). It discusses how to work with patterns and explains cutting-out methods. Chapter Two is devoted to different fabrics and how they work, focusing on the construction of a garment, including fastenings and trimmings, and the use of materials to support structured pieces, such as corsets. Hand-sewing techniques and basic seams are explored in Chapter Three. Techniques are demonstrated with step-by-step photographic guides combined with technical drawings. A guide to making garment details and decorations, such as pockets, waistlines, and necklines, is found in Chapter Four. Chapter Five addresses fabric-specific techniques, for everything from lace to neoprene. The best technical approaches to use for patternmaking and construction are discussed for each fabric. Catwalk images demonstrate how these kinds of techniques are employed by designers. The Global Forest Products Model (GFPM) book provides a complete introduction to this widely applied computer model. The GFPM is a dynamic economic equilibrium model that is used to predict production, consumption, trade, and prices of 14 major forest products in 180 interacting countries. The book thoroughly documents the methods, data, and computer software of the model, and demonstrates the model's usefulness in addressing international economic and environmental issues. The Global Forest Products Model is written by an international multi-disciplinary team and is ideal for graduate students and professionals in forestry, natural resource economics, and related fields. It explains trends in world forest industries in the simplest terms by explaining the economic theory underlying the model. It describes six applications of the GFPM, three of which were commissioned by the Food Agriculture of the United Nations, the USDA Forest Service, and New

Zealand Research. The authors show how to apply the model to real issues such as the effects of the Asian economic crisis on the forest sector, the effects of eliminating tariffs on international trade and production, and the international effects of national environmental policies. They provide complete explanations on how to use the GFPM software, prepare the data, make the forecasts, and summarize the results with tables and graphs. Comprehensive, and rigorous description of the world forestry sector Written by an international multi-disciplinary team Thorough description of data and methods In-depth applications to modern economic and policy issues Detailed documentation of the computer software Suitable for students, researchers, and decision makers
